코드 분석/구현

아래 코드를 분석하여 함수를 구현하세요.

점수는 전체 런타임 시간으로 산정됩니다.

```
#include <cstdio>
#include <cstdlib>
#include <memory.h>
using namespace std;
const int RANGE = 5000;
const int JUMP = 10000;
const int GENERATE = 10000;
const int LIMIT = 10000000;
int arr[LIMIT];
void sorting(int arr[], int number)
}
void swap(int * a, int * b)
        int temp = *a;
        *a = *b;
        *b = temp;
int main()
        srand(5);
        int score = 0;
        for (int TESTCASE = 0; TESTCASE < 10; TESTCASE++){</pre>
                 int mid = 0;
                 int number = 0;
                 memset(arr, 0, sizeof(arr));
                 for (int i = 0; i < GENERATE; i++){
                          mid += JUMP;
                          if ((rand() \% 20) == 0){
                                   int limit = number + GENERATE;
                                   for (; number < limit; number++){</pre>
```

```
int add = rand() % RANGE;
                                   if (rand() % 2)
                                           arr[number] = (mid + add);
                                   else
                                           arr[number] = (mid - add);
                          }
                 }
                 if (number >= LIMIT)
                          break;
        }
        for (int i = 0; i < number; i++){
                 swap(&arr[i], &arr[rand() % number]);
        sorting(arr, number);
         int check;
         for (check = 1; check < number; check++){</pre>
                 if (arr[check] < arr[check - 1])</pre>
                          break;
        }
        if (check == number){
                 score += 10;
                 printf("%d\n", 10);
        }
        else{
                 printf("%d\n", 0);
        }
}
printf("total : %d", score);
```

Input	Output
null	Null
